The Universal IV™ Series is the fourth generation RF continuous system built on Drexelbrook’s 50 years of experience in level measurement. The product is backward compatible with the industry standard Universal III™, Universal Lite™, Universal II™ and RCT™ Series and is the ideal solution for a wide array of applications.

A few enhancements to the Universal IV Series include worldwide hazardous location approval, standard display/keypad, autoranging capabilities and state of the art stable and accurate measurement.

Pro Model
The Universal IV™ Pro model integrates the RF Admittance technology pioneered by Drexelbrook with the versatility of Cote-Shield™ technology that ignores coatings on the probe and measurement span of 1” to 800’. The Pro is compatible with a vast array of applications: conductive, insulating, and heavy or light coating.

Lite Model
The Universal IV™ Lite model is the entry level RF Capacitance measurement system without Cote-Shield™ capabilities. Lite models can be used in non-coating conductive liquids and insulated coating applications where Cote-Shield™ is not required. In addition, the Lite model offers a measurement range up to 20’ typically.
One of the Drexelbrook’s key advantages is applications expertise. Drexelbrook offers more than products, we offer solutions that work. Our team of applications engineers will assist you with the ideal solution that solves your problem. The Universal IV can be successfully applied across various industries including: oil & gas, chemical, petrochemical, water & wastewater, power, food & beverage, pharmaceutical, pulp & paper, mining & aggregates, feed & grain and much more. Below are some typical applications examples.

**Typical Level Monitoring and Control**

**Integral vs. Remote configuration**
In integral configuration, the transmitter with display/keypad is mounted directly on the probe which is inserted in the vessel. The 2-wire 4-20mA output is typically monitored by a DCS/PLC system in the control room. In remote configuration the display/keypad is typically installed beside the vessel and is connected to the probe remotely via the remote cable. Remote installations are recommended in harsher environments where temperature and pressure extremes exist or for operator convenience and safety.

**Applications Examples**

**Oil and Gas Refining**

**Desalter / Dehydrators and electrostatic separators**
Oil/water separators are commonly used in the refining process to improve oil quality, control water dump and maximize throughput. A typical separator contains four phases: oil on top, water and sediment at the bottom and a two-part emulsion phase in-between. The Universal IV Pro model accurately and reliably measures the electrical interface within the emulsion layer even in upset conditions. The Universal IV allows operators to keep this electrical interface at an optimum distance from the electrostatic grid to maximize efficiency and throughput.

**Molten Sulfur**
Sulfur removal is a common application in oil and gas refining. Sulfur is a byproduct of removing sulfur-containing contaminants from natural gas and petroleum. The molten sulfur is an insulating liquid that can leave significant coating deposits on the sensor as the temperature of the sulfur may vary. The sulfur coatings are electrically insulating and easy to ignore for RF Admittance and RF Capacitance technologies. A 3-terminal Cote-Shield sensor allows the level measurement system to remain unaffected by coating deposits and ambient temperature variations.
Applications Examples (Continued)

**Water and Wastewater**

**Digesters**
Digesters are commonly used in sewage treatment plants to limit access to oxygen and encourage the generation of methane and carbon dioxide by microbes in the waste. Aerobic and anaerobic digestion is used to decompose organic matter to reduce volume. In some instances the Digester may be a floating roof tank. As the digestion process takes place and the bio-gas is generated, a floating roof tank may be utilized that will allow the user to contain and monitor the amount of bio-gas that is created above the sludge level. The Universal IV Pro model would be the technology of first choice. With the use of a flexible cable sensor we can either measure the level of the digester and ignore the heavy foam build-up on the sensor, or mount to the floating roof and measure the bio-gas volume above the digester level. Probe model 700-0005-018 has many years of proven history in these applications.

**Equalization tanks**
Equalization tanks collect water, wastewater, recycled water from wastewater streams, microfiltration systems, reverse osmosis systems and others. This water typically has a high concentration of manganese, iron, chlorine and other chemicals that builds up heavily on the probe. The Universal IV Pro is the ideal solution for this application due to its ability to reject build up on the probe and its immunity to heavy water flows and agitation.

**Pharmaceutical / Biotech**

**De-Ionized Water**
De-Ionized Water (DI Water) Level Measurement and Control requires an understanding of the measurement parameters and level technology. DI Water conductivities commonly range from 1 – 10 micromhos / microsiemens or more. Simple capacitance level systems “drift” with normal variations in DI Water conductivity. Conductance technologies are mislead by the extremely low conductivity of DI Water. Drexelbrook RF systems will accurately, reliably and repeatedly make DI Water measurements without “drift” by the correct selection of the electronic module frequency and sensing element. Performance is unaffected by variations in DI Water conductivity variations. Drexelbrook has successfully made this difficult measurement for over 40 years in the medical, pharmaceutical and biotech industries.
**Probe Selection**

The Universal IV™ Series has one of the richest and most versatile probe selections in the industry. Over 125 probes can be selected as a standard option in the Universal IV model number and many special probes can be customized upon request. Drexelbrook’s bonded probe construction ensures the highest probe quality and measurement reliability. This table summarizes a few commonly used probes. Our applications engineers can assist you with selecting the right probe for your application.

Backward Compatibility
Drexelbrook has installed countless RF continuous level systems in the field over the past 50 years. We ensure our customers with existing installations are fully supported with a seamless migration path to new products and spares. The Universal IV™ Series is fully compatible with its predecessors such as: the Universal Lite™, Universal III™, and RCT™. Furthermore, all probes (models 700-xxxx-xxx) are common across all of Drexelbrook’s RF products. Therefore, the migration to the Universal IV™ Series is seamless and transparent to the user.

Electronics Upgrade Kit for Existing Systems
Leave Your Probe in the Tank and Upgrade Your Electronic Housing

To upgrade your existing Universal Lite, Universal III or RCT system you don’t have to remove the probe from the tank. Just remove the old housing and mount the new Universal IV Housing on your existing probe.

You don’t even have to know the probe model number. The universal retrofit kit model ‘R00’ includes all necessary adapters for all possible connections to the probe.

Order your retrofit kit as follows: Model # Unn1010000-R00 ‘nn’ can be P0, P2, P1, P3, L0 or L1 to match your existing ‘409’ electronics according to the table above.
### Specifications

#### Technology
- RF Admittance / Capacitance

#### Supply Voltage
- 13-30VDC, 2-wire loop powered

#### Output/Digital Protocol
- 4-20mA, HART
  - Compatible with HART®
  - HART device description available

#### Load Resistance
- Maximum 550 ohms at 24 VDC
- Minimum 250 ohms for HART protocol

#### Ambient Temperature
- -40°C to 75°C (-40°F to 167°F)

#### Process Temperature
- -106°C to 815°C (-160°F to 1500°F), probe dependent

#### Process Pressure
- Vacuum to 1350 bar (20,000 psi), probe dependent

#### Process Connection
- NPT, BSP, JIS, ANSI, DIN, Grayloc, Tri-Clamp, Perlick Fitting and more upon request

#### Main Wetted Parts
- 316L, PVDF, TFE, FEP, PFA, HastelloyC, Monel and more depending on applications requirements. Consult factory

#### Sensor Length
- 1” to 800 Feet (25.4mm to 244m)
  - Probe, Pro and Lite model dependent

#### Capacitance Measurement Range
- Autoranging (6 ranges)
  - 1-45,000 pF (Pro model)
  - 20-7,000 pF (Lite model)

#### Cote-Shield™
- Pro model: Coating rejection with 100Khz or 15Khz and 45° phasing
- Lite model: 100Khz or 15Khz without phasing for insulating coating or conductive non-coating applications only

#### Integral or Remote Configuration
- 100 ft max cable length for remote configuration

#### Accuracy
- 0.25% of span (ranges 2-6)
- Includes the effects of linearity, hysteresis and repeatability on electronics only

#### Response Time to Level Changes
- 350 msec nominal (no damping applied)
- 1-90 seconds programmable damping time

#### Supply Voltage Effect
- 0.2% of full scale max

#### Temperature Effect
- 0.5% per 100°F (37.7°C) change

#### Start-Up Time
- < 12 seconds

#### Configuration and Calibration
- Standard LCD display and keypad on all models
- HRTWIN™ PC-based software
- Or third party Model 275, 375, 475 handheld communicator

#### Emission and Surge Protection
- Compliant with IEC6100-4.2, 3, 4, 6, 8
- Compliant with CISPR11 Group I, Class B

#### Approvals
- Intrinsically Safe (IS)
- Explosion Proof (XP) without IS barrier
- FM, FMc, ATEX, IECEx
- CE Mark
